Homework Assignment 6

Yixin Ma(4004285971),Runhan Huang(40047799),Kunhan Liang(400315267) 2025-04-13

```
import pandas as pd
from sklearn.preprocessing import StandardScaler
from sklearn.model_selection import train_test_split
from sklearn.cluster import KMeans
from sklearn.decomposition import PCA
from sklearn.metrics import silhouette_score, silhouette_samples
import matplotlib.pyplot as plt
import matplotlib.cm as cm
import numpy as np
import seaborn as sns
from sklearn.linear_model import LogisticRegression
from sklearn.metrics import accuracy_score, confusion_matrix,

    classification_report

from sklearn.model_selection import cross_val_score
from sklearn.tree import DecisionTreeClassifier
from mlxtend.feature_selection import SequentialFeatureSelector as SFS
from sklearn.ensemble import RandomForestClassifier
from sklearn.model_selection import GridSearchCV
```

(1)

A classification problem is to use a set of 13 features to predict whether a person has heart disease or not.

(2)

```
# Load the dataset
data = pd.read_csv('ass6-dataset.csv')
```

```
# Scale the data (excluding the target variable "num")
features = data.drop(columns=['num'])
scaler = StandardScaler()
scaled_features = scaler.fit_transform(features)
scaled_data = pd.DataFrame(scaled_features, columns=features.columns)
scaled_data['num'] = data['num']
```

(3)

```
# Get the list of variables of the dataset
variables = data.columns.tolist()
print("Variables in the dataset:")
for var in variables:
   print(var)
# Get a summary of the dataset
summary = data.describe()
print("\nSummary of the dataset:")
print(summary)
# Get the number of observations
num_observations = data.shape[0]
print(f"\nNumber of observations: {num_observations}")
# Get the data types of the variables
data_types = data.dtypes
print("\nData types of the variables:")
print(data_types)
# Get the distribution of the variables
print("\nDistribution of the variables:")
```

```
for var in variables:
    print(f"\n{var}:")
    print(data[var].value_counts())
    print(data[var].describe())
    print(data[var].hist())
```

Variables in the dataset:

age

The dataset contains missing values and have different scales and distributions. For the variables, sex, fbs, exang are binary variables, oldpeak is a continuous variable, and the remaining variables are numeric variables. There are 303 observations in the dataset.

(4)

```
# Convert the num column to a binary variable
scaled_data['num'] = scaled_data['num'].apply(lambda x: 1 if x > 0 else 0)
```

Testing set size: 90

(9)

We select:

1. Logistic Regression

Logistic regression always used for binary classification problems. Because it is really efficiency for small/medium datasets. The structure of it is easy and has great interpretability. In this case we are analysising the heart disease dataset, and by previous knowledge we know logistic regression is suitale for this kind of dataset. So the first one we choose is logistic regression.

2. Decision Tree

Decision tree is a very well understood model that divides data into different categories step by step by constantly making "yes" and "no" judgments on features. It is very easy to operate because we don't need to standardize the data in advance, and it can handle different types of data at the same time. I think its biggest advantage is that it has a clear structure, and it can draw very graphical diagrams to see how to make decisions at each step, which is very helpful for medical data analysis, because the model is very explanatory and easy to understand. For example, let's judge each item in this data on a finger-by-finger basis.

(10)

We choose accuracy and precision.

1. Accuracy:

formula when calculating 'Accuracy = (TP + TN) / (TP + TN + FP + FN)' TP is True Positive, TN is True Negative; FP is False Positive, FN is False Negative.

It is one of the most commonly used metrics to measure the overall performance of a classification model. It shows how many times the model predicted correctly and what percentage of the total predictions were made.

2. Sensitivity:

Formula when calculating 'Sensitivity = TP / (TP + FN)' TP is True Positive, FN is False Negative.

Sensitivity measures how well the model identifies actual positive cases. In other words, sensitivity shows what proportion of people who are actually "have problem" were correctly predicted as "have problem/sick" by the model. A high sensitivity means the model is good at detecting all real cases, even sometimes it maybe too sensitive. But if we cannot identify someone is actual "have problem" it may lead to very bad situation.

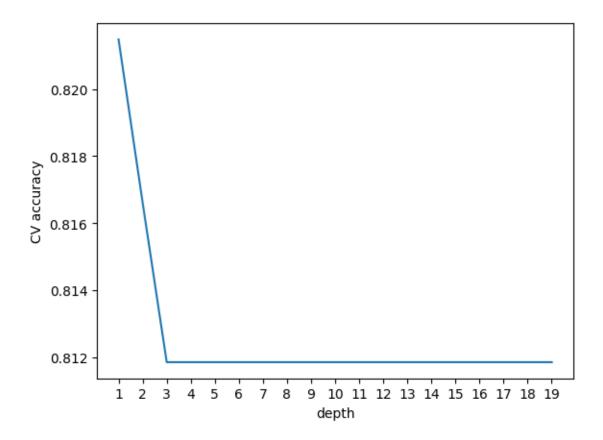

(11)

```
# identify optimal tuning parameters using cross validation
depth_range = range(1, 20)
cv_scores = []
for k in depth_range:
    heart_disease_log = LogisticRegression(max_iter=120, C=k)
# 5-fold cross-validation using accuracy
    cv_scores_k = cross_val_score(
       heart_disease_log,
       X_train,
        y_train,
        cv=5,
        scoring='accuracy'
    )
# append the average accuracy across all folds
    cv_scores.append(np.mean(cv_scores_k))

        cv=5,
        scoring='accuracy'
```

```
)
    cv_scores.append(np.mean(cv_scores_k))
optimal_depth_index = np.argmax(cv_scores)
optimal_depth = depth_range[optimal_depth_index]
print("Optimal max_depth: ", optimal_depth)
# train decision tree model with selected features
m_sfs = DecisionTreeClassifier(
    criterion='gini',
    random_state=0,
    max_depth=optimal_depth
)
m_sfs.fit(X_train_sfs, y_train)
Optimal max_depth: 3
DecisionTreeClassifier(max_depth=3, random_state=0)
The optimal tuning parameter for decision tree is optimal max depth: 3.
(13)
# confusion matrix for logistic regression
y_test_hat = heart_disease_log.predict(X_test)
cm_log = confusion_matrix(y_test, y_test_hat)
total1 = sum(sum(cm_log))
accuracy_log = (cm_log[0,0]+cm_log[1,1])/total1
print("Logistic Regression Accuracy: ", accuracy_log)
sensitivity_log = \operatorname{cm_log}[1,1]/(\operatorname{cm_log}[1,0]+\operatorname{cm_log}[1,1])
```

print("Logistic Regression Sensitivity: ", sensitivity_log)

```
y_pred_dt = heart_disease_dt.predict(X_test)
# confusion matrix for decision tree
cm_dt = confusion_matrix(y_test, y_pred_dt)
total2 = sum(sum(cm dt))
accuracy_dt = (cm_dt[0,0]+cm_dt[1,1])/total2
print("Decision Tree Accuracy: ", accuracy_dt)
sensitivity_dt = cm_dt[1,1]/(cm_dt[1,0]+cm_dt[1,1])
print("Decision Tree Sensitivity: ", sensitivity_dt)
y_pred_sfs = m_sfs.predict(X_test_sfs)
# confusion matrix for decision tree with selected features
cm_sfs = confusion_matrix(y_test, y_pred_sfs)
total3 = sum(sum(cm_sfs))
accuracy_sfs = (cm_sfs[0,0]+cm_sfs[1,1])/total3
print("Decision Tree with Selected Features Accuracy: ", accuracy_sfs)
sensitivity_sfs = cm_sfs[1,1]/(cm_sfs[1,0]+cm_sfs[1,1])
print("Decision Tree with Selected Features Sensitivity: ", sensitivity sfs)
```

The Logistic Regression model has a higher accuracy than the Decision Tree model. However, the Decision Tree model has a higher sensitivity, which means it is better at identifying positive cases. Both accuracy and sensitivity for Decision Tree model with SFS are bit higher than the original Decision Tree model. This indicates that feature selection has improved the performance of the classifier.

(14)

```
# The best interpretable model identified in (13) is logistic regression.
coefficients = heart_disease_log.coef_[0]
feature_importance = pd.DataFrame(
    {'Feature': X_train.columns,
     'Coefficient': coefficients}
)
feature_importance['Importance'] = np.abs(feature_importance['Coefficient'])
feature_importance = feature_importance.sort_values(by='Importance',

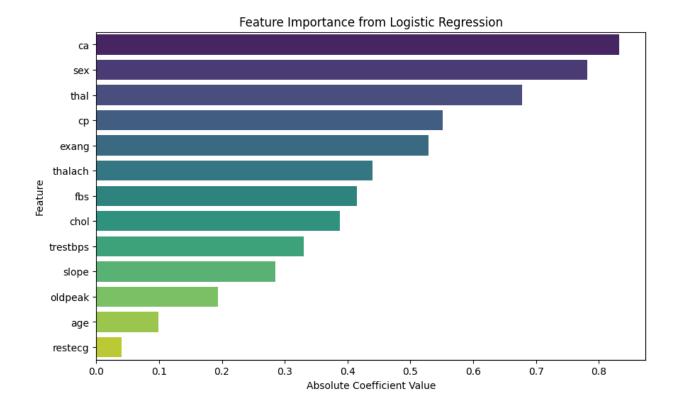

¬ ascending=False)

plt.figure(figsize=(10, 6))
sns.barplot(x='Importance', y='Feature', data=feature_importance,

→ palette='viridis')

plt.title('Feature Importance from Logistic Regression')
plt.xlabel('Absolute Coefficient Value')
plt.ylabel('Feature')
plt.show()
```

```
/tmp/ipykernel_693798/1559183592.py:10: FutureWarning:
Passing `palette` without assigning `hue` is deprecated and will be removed in v0.14.0. Assign
sns.barplot(x='Importance', y='Feature', data=feature_importance, palette='viridis')
```

The most important predictor variables is 'ca', which is the number of major vessels (0-3) colored by fluoroscopy. This variable has a positive coefficient, indicating that as the number of major vessels increases, the likelihood of having heart disease also increases. This suggests that individuals with more major vessels are at a higher risk of heart disease.

Best parameters for Random Forest Classifier:
{'max_depth': None, 'min_samples_leaf': 4, 'min_samples_split': 2, 'n_estimators': 300}
Random Forest Classifier Accuracy: 0.83333333333333333
Random Forest Classifier Sensitivity: 0.7380952380952381
/tmp/ipykernel_693798/3033109590.py:54: FutureWarning:
Passing `palette` without assigning `hue` is deprecated and will be removed in v0.14.0. Assign
  sns.barplot(x='Importance', y='Feature', data=feature_importance_rf, palette='viridis')
Text(0, 0.5, 'Feature')
```

The improved model is based on the original Decision Tree model with SFS. The original Decision Tree has accuracy: 0.74 and sensitivity: 0.78, and the improved model has accuracy: 0.83 and sensitivity: 0.73.
